

Detailed data analytics improve performance metrics

Background

Clinical care settings rely on teams with many layers to function at their optimum capacity.

The administrative personnel at a given clinic may contribute to physician performance and productivity, as well as overall site performance and revenue efficiencies.

Challenge

National and regional practice benchmarking statistics are difficult to find. Further, data mining to capture individual physician data for internal benchmarking purposes can be very time consuming for a practice administrator.

Solution

Vestrum Health® Data supports administrative personnel in increasing site performance and improving revenue efficiencies by providing monthly and annual Quick Trends reports. These reports contain information on patient encounters, medication exposure, visual acuity outcomes, and other key performance indicators.

In addition to intra-clinical metrics and analysis, Quick Trends reports provide inter-clinical and regional snapshots, providing benchmarking opportunities.

Data security is ensured through industry standard procedures.

Outcome

Quick Trends by Vestrum Health® Data provides a quick dashboard with reliable and secure data, allowing practice administrators to effectively summarize practice performance. Based on performance, physicians can adjust clinic protocols to optimize practice performance metrics.
